Employee Directory (Django)

Charan Pittala | Hyderabad | MCA 2026 | Python, SQL, Snowflake, Power BI, Django
GitHub: https://github.com//employee-directory

Problem

Employee records often live in scattered spreadsheets. This app keeps them in one place: name, photo, role/responsibilities and salary, with an admin panel to manage the data.

What I built

• Django backend with models, views and templates for employee records
• Photo upload, role/responsibilities and salary fields per employee
• Front end with HTML, CSS and JavaScript
• Django admin panel for managing data
• Config kept in a .env file; code versioned with Git

Role of AI

• Windsurf (AI coding assistant) scaffolded the project structure and boilerplate
• I wrote and debugged the core logic myself: models, views, templates, static file setup
• Used AI to speed up debugging (e.g. template syntax errors) while learning Django from scratch

Tech stack

Backend	Python, Django
Frontend	HTML, CSS, JavaScript
Tools	Git, GitHub, VS Code, Windsurf

Next steps

• Search and filter employees
• Natural-language search using an LLM (planned, not built yet)
• Dockerize and add CI
